%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
```

```
% (1) Basics
```

```
% The symbol "%" is used to indicate a comment (for the remainder of
% the line).
```

```
% When writing a long Matlab statement that becomes too long for a
% single line use "..." at the end of the line to continue on the next
% line. E.g.
```

```
A = [1, 2; ...
     3, 4];
```

```
% A semicolon at the end of a statement means that Matlab will not
% display the result of the evaluated statement. If the ";" is omitted
% then Matlab will display the result. This is also useful for
% printing the value of variables, e.g.
```

```
A
```

```
% Matlab's command line is a little like a standard shell:
% - Use the up arrow to recall commands without retyping them (and
%   down arrow to go forward in the command history).
% - C-a moves to beginning of line (C-e for end), C-f moves forward a
%   character and C-b moves back (equivalent to the left and right
%   arrow keys), C-d deletes a character, C-k deletes the rest of the
%   line to the right of the cursor, C-p goes back through the
%   command history and C-n goes forward (equivalent to up and down
```

```

% arrows), Tab tries to complete a command.

% Simple debugging:
% If the command "dbstop if error" is issued before running a script
% or a function that causes a run-time error, the execution will stop
% at the point where the error occurred. Very useful for tracking down
% errors.

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

% (2) Basic types in Matlab

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
% (A) The basic types in Matlab are scalars (usually double-precision
% floating point), vectors, and matrices:

A = [1 2; 3 4];           % Creates a 2x2 matrix
B = [1,2; 3,4];          % The simplest way to create a matrix is
                        % to list its entries in square brackets.
                        % The ";" symbol separates rows;
                        % the (optional) "," separates columns.

N = 5                    % A scalar
v = [1 0 0]              % A row vector
v = [1; 2; 3]            % A column vector
v = v'                   % Transpose a vector (row to column or
                        % column to row)
v = 1:.5:3               % A vector filled in a specified range:
v = pi*[-4:4]/4          % [start:stepsize:end]
                        % (brackets are optional)
v = []                   % Empty vector

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
% (B) Creating special matrices: 1ST parameter is ROWS,
% 2ND parameter is COLS

m = zeros(2, 3)          % Creates a 2x3 matrix of zeros
v = ones(1, 3)           % Creates a 1x3 matrix (row vector) of ones
m = eye(3)               % Identity matrix (3x3)
v = rand(3, 1)           % Randomly filled 3x1 matrix (column
                        % vector); see also randn

                        % But watch out:

```

```

m = zeros(3)                % Creates a 3x3 matrix (!) of zeros

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
% (C) Indexing vectors and matrices.
% Warning: Indices always start at 1 and *NOT* at 0!

v = [1 2 3];
v(3)                        % Access a vector element

m = [1 2 3 4; 5 7 8 8; 9 10 11 12; 13 14 15 16]
m(1, 3)                     % Access a matrix element
                             %      matrix(ROW #, COLUMN #)
m(2, :)                     % Access a whole matrix row (2nd row)
m(:, 1)                     % Access a whole matrix column (1st column)

m(1, 1:3)                   % Access elements 1 through 3 of the 1st row
m(2:3, 2)                  % Access elements 2 through 3 of the
                             %      2nd column
m(2:end, 3)                % Keyword "end" accesses the remainder of a
                             %      column or row

m = [1 2 3; 4 5 6]
size(m)                    % Returns the size of a matrix
size(m, 1)                 % Number of rows
size(m, 2)                 % Number of columns

m1 = zeros(size(m))        % Create a new matrix with the size of m

who                         % List variables in workspace
whos                       % List variables w/ info about size, type, etc.

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
% (3) Simple operations on vectors and matrices

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
% (A) Element-wise operations:

% These operations are done "element by element".  If two
% vectors/matrices are to be added, subtracted, or element-wise
% multiplied or divided, they must have the same size.

a = [1 2 3 4]';            % A column vector

```

```

2 * a           % Scalar multiplication
a / 4          % Scalar division
b = [5 6 7 8]'; % Another column vector
a + b         % Vector addition
a - b         % Vector subtraction
a .^ 2        % Element-wise squaring (note the ".")
a .* b        % Element-wise multiplication (note the ".")
a ./ b        % Element-wise division (note the ".")

log([1 2 3 4]) % Element-wise logarithm
round([1.5 2; 2.2 3.1]) % Element-wise rounding to nearest integer

% Other element-wise arithmetic operations include e.g. :
% floor, ceil, ...

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
% (B) Vector Operations
% Built-in Matlab functions that operate on vectors

a = [1 4 6 3] % A row vector
sum(a)       % Sum of vector elements
mean(a)      % Mean of vector elements
var(a)       % Variance of elements
std(a)       % Standard deviation
max(a)       % Maximum
min(a)       % Minimum

% If a matrix is given, then these functions will operate on each column
% of the matrix and return a row vector as result
a = [1 2 3; 4 5 6] % A matrix
mean(a)          % Mean of each column
max(a)          % Max of each column
max(max(a))     % Obtaining the max of a matrix
mean(a, 2)      % Mean of each row (second argument specifies
               % dimension along which operation is taken)

[1 2 3] * [4 5 6]' % 1x3 row vector times a 3x1 column vector
               % results in a scalar. Known as dot product
               % or inner product. Note the absence of "."

[1 2 3]' * [4 5 6] % 3x1 column vector times a 1x3 row vector
               % results in a 3x3 matrix. Known as outer
               % product. Note the absence of "."

```

```
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
```

```
% (C) Matrix Operations:
```

```
a = rand(3,2)           % A 3x2 matrix
b = rand(2,4)           % A 2x4 matrix
c = a * b               % Matrix product results in a 3x4 matrix
```

```
a = [1 2; 3 4; 5 6];   % A 3x2 matrix
b = [5 6 7];           % A 1x3 row vector
b * a                   % Vector-matrix product results in
                        % a 1x2 row vector
c = [8; 9];            % A 2x1 column vector
a * c                   % Matrix-vector product results in
                        % a 3x1 column vector
```

```
a = [1 3 2; 6 5 4; 7 8 9]; % A 3x3 matrix
inv(a)                  % Matrix inverse of a
eig(a)                  % Vector of eigenvalues of a
[V, D] = eig(a)         % D matrix with eigenvalues on diagonal;
                        % V matrix of eigenvectors
                        % Example for multiple return values!
[U, S, V] = svd(a)      % Singular value decomposition of a.
                        % a = U * S * V', singular values are
                        % stored in S
```

```
% Other matrix operations: det, norm, rank, ...
```

```
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
```

```
% (D) Reshaping and assembling matrices:
```

```
a = [1 2; 3 4; 5 6];   % A 3x2 matrix
b = a(:)                % Make 6x1 column vector by stacking
                        % up columns of a
sum(a(:))               % Useful: sum of all elements
```

```
a = reshape(b, 2, 3)    % Make 2x3 matrix out of vector
                        % elements (column-wise)
```

```
a = [1 2]; b = [3 4];  % Two row vectors
c = [a b]                % Horizontal concatenation (see horzcat)
```

```
a = [1; 2; 3];         % Column vector
c = [a; 4]               % Vertical concatenation (see vertcat)
```

```
a = [eye(3) rand(3)]    % Concatenation for matrices
```

```

b = [eye(3); ones(1, 3)]

b = repmat(5, 3, 2)           % Create a 3x2 matrix of fives
b = repmat([1 2; 3 4], 1, 2) % Replicate the 2x2 matrix twice in
                             % column direction; makes 2x4 matrix
b = diag([1 2 3])            % Create 3x3 diagonal matrix with given
                             % diagonal elements

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
% (4) Control statements & vectorization

% Syntax of control flow statements:
%
% for VARIABLE = EXPR
%     STATEMENT
%     ...
%     STATEMENT
% end
%
%     EXPR is a vector here, e.g. 1:10 or -1:0.5:1 or [1 4 7]
%
%
% while EXPRESSION
%     STATEMENTS
% end
%
% if EXPRESSION
%     STATEMENTS
% elseif EXPRESSION
%     STATEMENTS
% else
%     STATEMENTS
% end
%
% (elseif and else clauses are optional, the "end" is required)
%
% EXPRESSIONs are usually made of relational clauses, e.g. a < b
% The operators are <, >, <=, >=, ==, ~= (almost like in C(++))

% Warning:
% Loops run very slowly in Matlab, because of interpretation overhead.
% This has gotten somewhat better in version 6.5, but you should
% nevertheless try to avoid them by "vectorizing" the computation,
% i.e. by rewriting the code in form of matrix operations. This is
% illustrated in some examples below.

```

```

% Examples:
for i=1:2:7           % Loop from 1 to 7 in steps of 2
    i                 % Print i
end

for i=[5 13 -1]      % Loop over given vector
    if (i > 10)       % Sample if statement
        disp('Larger than 10') % Print given string
    elseif i < 0     % Parentheses are optional
        disp('Negative value')
    else
        disp('Something else')
    end
end

% Here is another example: given an mxn matrix A and a 1xn
% vector v, we want to subtract v from every row of A.

m = 50; n = 10; A = ones(m, n); v = 2 * rand(1, n);
%
% Implementation using loops:
for i=1:m
    A(i,:) = A(i,:) - v;
end

% We can compute the same thing using only matrix operations
A = ones(m, n) - repmat(v, m, 1); % This version of the code runs
% much faster!!!

% We can vectorize the computation even when loops contain
% conditional statements.
%
% Example: given an mxn matrix A, create a matrix B of the same size
% containing all zeros, and then copy into B the elements of A that
% are greater than zero.

% Implementation using loops:
B = zeros(m,n);
for i=1:m
    for j=1:n
        if A(i,j)>0
            B(i,j) = A(i,j);
        end
    end
end

```

```
end
```

```
% All this can be computed w/o any loop!
```

```
B = zeros(m,n);  
ind = find(A > 0);           % Find indices of positive elements of A  
                               % (see "help find" for more info)  
B(ind) = A(ind);           % Copies into B only the elements of A  
                               % that are > 0
```

```
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%  
%(5) Saving your work
```

```
save myfile                % Saves all workspace variables into  
                           % file myfile.mat  
save myfile a b            % Saves only variables a and b  
  
clear a b                  % Removes variables a and b from the  
                           % workspace  
clear                      % Clears the entire workspace  
  
load myfile                % Loads variable(s) from myfile.mat
```

```
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%  
%(6) Creating scripts or functions using m-files:
```

```
%  
% Matlab scripts are files with ".m" extension containing Matlab  
% commands. Variables in a script file are global and will change the  
% value of variables of the same name in the environment of the current  
% Matlab session. A script with name "script1.m" can be invoked by  
% typing "script1" in the command window.
```

```
% Functions are also m-files. The first line in a function file must be  
% of this form:
```

```
% function [outarg_1, ..., outarg_m] = myfunction(inarg_1, ..., inarg_n)  
%
```

```
% The function name should be the same as that of the file  
% (i.e. function "myfunction" should be saved in file "myfunction.m").  
% Have a look at myfunction.m and myotherfunction.m for examples.
```

```
%  
% Functions are executed using local workspaces: there is no risk of  
% conflicts with the variables in the main workspace. At the end of a  
% function execution only the output arguments will be visible in the  
% main workspace.
```

```

a = [1 2 3 4];           % Global variable a
b = myfunction(2 * a)   % Call myfunction which has local
                        % variable a
a                        % Global variable a is unchanged

[c, d] = ...
    myotherfunction(a, b) % Call myotherfunction with two return
                        % values

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
%(7) Plotting

x = [0 1 2 3 4];       % Basic plotting
plot(x);               % Plot x versus its index values
pause                 % Wait for key press
plot(x, 2*x);         % Plot 2*x versus x
axis([0 8 0 8]);      % Adjust visible rectangle

figure;               % Open new figure
x = pi*[-24:24]/24;
plot(x, sin(x));
xlabel('radians');    % Assign label for x-axis
ylabel('sin value');  % Assign label for y-axis
title('dummy');       % Assign plot title

figure;
subplot(1, 2, 1);     % Multiple functions in separate graphs
plot(x, sin(x));      % (see "help subplot")
axis square;         % Make visible area square
subplot(1, 2, 2);
plot(x, 2*cos(x));
axis square;

figure;
plot(x, sin(x));
hold on;              % Multiple functions in single graph
plot(x, 2*cos(x), '--'); % '--' chooses different line pattern
legend('sin', 'cos'); % Assigns names to each plot
hold off;             % Stop putting multiple figures in current
                    % graph

figure;               % Matrices vs. images
m = rand(64,64);
imagesc(m)            % Plot matrix as image
colormap gray;       % Choose gray level colormap

```

```

axis image;                % Show pixel coordinates as axes
axis off;                  % Remove axes

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
%(8) Working with (gray level) images

I = imread('cit.png');    % Read a PNG image

figure
imagesc(I)                % Display it as gray level image
colormap gray;
